

How to Use the Kindroid Chat Exporter

This guide explains how to use the Kindroid Chat Exporter script, even if you do not normally use Python or the terminal.

The script downloads your Kindroid chat messages and saves them as a `.json` file on your computer. A JSON file is just a structured text file. It may look weird at first, but it is a common format that can be opened, searched, backed up, converted, or used later with other tools.

What This Script Does

This script can export:

- A one-on-one Kindroid AI chat
- A Kindroid group chat

It asks for your Kindroid API key, asks which AI or group you want to export, then downloads the messages page by page.

It also saves its progress as it goes. If the export gets interrupted, rate limited, or stopped, you can usually resume instead of starting over.

What You Need Before Starting

You need four things:

1. Python installed on your computer
2. The script file, usually named `app.py`
3. Your Kindroid API key
4. The AI ID or group ID you want to export

The API key is what allows the script to access your Kindroid account. Treat it like a password.

Do not post your API key publicly. Do not upload it to GitHub. Do not share it with strangers. Anyone with your API key may be able to access or change things in your Kindroid account.

Step 1: Install Python

Windows

Open the Microsoft Store and search for:

```
Python
```

Install the latest Python version.

Or download Python from the official Python website.

During installation, if you see an option that says:

```
Add Python to PATH
```

check that box.

If you are not sure whether Python is installed, open Command Prompt and type:

```
python --version
```

If that does not work, try:

```
py --version
```

If you see something like this, you are good:

```
Python 3.12.4
```

The exact numbers do not need to match.

macOS

Open Terminal and type:

```
python3 --version
```

If Python is installed, you will see something like:

```
Python 3.12.4
```

If Python is not installed, install it from the official Python website.

Linux

Open Terminal and type:

```
python3 --version
```

Most Linux systems already have Python installed.

Step 2: Put the Script Somewhere Easy to Find

Download or save the script as:

```
app.py
```

Put it somewhere simple, such as your Downloads folder or a folder on your Desktop.

For example:

```
Downloads/kindroid-exporter/app.py
```

Keeping the script in its own folder is a good idea because the exported chat files will be saved in that same folder unless you choose a different location.

Step 3: Open the Terminal in the Script Folder

The terminal is the black or white text window where you type commands.

Windows

Open the folder where `app.py` is saved.

Click in the address bar at the top of File Explorer, type:

```
cmd
```

and press Enter.

A Command Prompt window should open directly in that folder.

macOS

Open Terminal.

Type `cd`, then drag the folder containing `app.py` into the Terminal window.

It will look something like this:

```
cd /Users/yourname/Downloads/kindroid-exporter
```

Press Enter.

Linux

Open Terminal.

Use `cd` to go to the folder where the script is saved.

Example:

```
cd ~/Downloads/kindroid-exporter
```

Step 4: Install the Required Python Package

The script needs a Python package called `requests`.

In the terminal, run:

Windows

```
python -m pip install requests
```

If that does not work, try:

```
py -m pip install requests
```

macOS or Linux

```
python3 -m pip install requests
```

If it says `requests` is already installed, that is fine.

Step 5: Run the Script

In the same terminal window, run:

Windows

```
python app.py
```

If that does not work, try:

```
py app.py
```

macOS or Linux

```
python3 app.py
```

You should see something like:

```
Kindroid Chat Exporter
=====

Exports messages for Kindroid AIs and group chats.
Your API key is used only in this session and is never saved.

Enter your Kindroid API key (starts with kn_):
```

Step 6: Enter Your Kindroid API Key

Paste your Kindroid API key and press Enter.

Important: when you paste or type the API key, you may not see anything appear on the screen.

That is normal.

The script hides the key while you type it so someone looking at your screen cannot read it.

Your API key should start with:

```
kn_
```

If the script warns you that the key does not look right, double-check that you copied the full key and did not accidentally include extra spaces.

Step 7: Choose What You Want to Export

After entering your API key, you will see the main menu:

```
Main menu
  1) Export an AI or group chat
  2) View session summary
  3) Quit
```

Choose:

```
1
```

and press Enter.

Then you will see:

```
Export type:
  1) Single AI  (ai_id)
  2) Group chat (group_id)
Choose [1/2, default 1]:
```

Choose for a normal one-on-one AI chat.

Choose for a group chat.

If you just press Enter, the script chooses option .

Step 8: Enter the AI ID or Group ID

If you chose a single AI export, the script will ask:

```
Enter the AI ID to export:
```

Paste the AI ID and press Enter.

If you chose a group chat export, it will ask:

```
Enter the group ID to export:
```

Paste the group ID and press Enter.

Your AI ID and API key are usually found in Kindroid's Profile Settings. Group IDs may need to be found from the app or from network/API details, depending on what Kindroid exposes in the interface.

Step 9: Choose an Output File Name

The script will suggest a file name like:

```
kindroid_export_YOUR_ID_HERE.json
```

You can press Enter to accept the default.

That is usually the easiest choice.

Or you can type your own file name, such as:

```
Lisa_chat_export.json
```

For best results, end the file name with:

```
.json
```

Step 10: Wait for the Export to Finish

The script will start downloading messages.

You will see progress like this:

```
Fetching page 1... 100 messages fetched. Total: 100.  
Waiting 3.2s before next page...  
Fetching page 2... 100 messages fetched. Total: 200.
```

This means it is working.

The export may take a while if the chat is long.

Kindroid may also rate limit the script. If that happens, you may see:

```
Rate limited. Pausing for 60.0 seconds...
Progress is saved; this can safely take its time.
```

That is not necessarily an error. It means Kindroid told the script to slow down. The script will wait and then continue.

Do not run several exports at the same time. That can make rate limits worse.

Step 11: When the Export Is Complete

When the export finishes, you will see something like:

```
Export complete – 2450 messages saved to Lisa_chat_export.json.
```

The exported file will usually be in the same folder as `app.py`.

The script may ask:

```
Delete checkpoint file now that export is complete? [Y/n]:
```

If the export completed successfully, press Enter or type:

```
Y
```

The checkpoint file is only needed for resuming an incomplete export.

What Is the Checkpoint File?

The script creates a file called:

```
kindroid_export_checkpoint.json
```

This file helps the script remember where it left off.

If the export stops halfway through, run the script again. If the checkpoint matches the same AI or group, the script should ask whether you want to resume.

You will see something like:

```
Found a previous checkpoint for this export.  
Previous output file : Lisa_chat_export.json  
Messages already saved: 1200  
Last timestamp      : 1739326596474  
Resume from this checkpoint? [Y/n]:
```

Press Enter to resume.

How to Stop the Script Safely

If you need to stop the script while it is running, press:

```
Ctrl + C
```

That means hold the Control key and press C.

The script should stop and keep the checkpoint file so you can resume later.

How to Export Multiple Chats

After one export finishes, the script returns to the main menu.

Choose:

```
1
```

again to export another AI or group chat.

You do not need to enter your API key again during the same session.

When you are done, choose:

```
3
```

to quit.

The script will show a session summary listing the exports you ran.

Where the Exported File Goes

By default, the exported `.json` file is saved in the folder where you ran the script.

For example, if `app.py` is in:

```
Downloads/kindroid-exporter
```

then your exported file will probably also be in:

```
Downloads/kindroid-exporter
```

If you cannot find it, look for a file named something like:

```
kindroid_export_abc123.json
```

or whatever file name you chose.

How to Open the Exported File

A `.json` file can be opened with a text editor.

Good options include:

- Notepad on Windows
- TextEdit on macOS
- Visual Studio Code
- Notepad++
- Any code editor

For large chats, basic Notepad may struggle. Visual Studio Code or Notepad++ will usually work better.

The file will look something like this:

```
[
  {
    "id": "YP3GVPBNtGVpNY1dKgIO",
    "sender": "ai",
    "timestamp": 1739326596474,
    "message": "Hi Matthew, thank you for creating me! What a world I was just
born into."
  },
  {
    "id": "another_message_id",
    "sender": "user",
    "timestamp": 1739326600000,
```

```
[{"message": "Hi!"},
]
```

Each message is saved as a separate item.

What the Message Fields Mean

Common fields include:

id

A unique ID for that message.

sender

Who sent the message. This may say `user` or `ai`.

sender_type

Another field that may describe the sender type. It may not appear on every message.

display_name

The display name, if Kindroid provides it. Some exports may not include this field.

timestamp

The time the message was sent, stored as a computer timestamp.

message

The actual text of the message.

Some messages may also include image, video, internet, or link fields.

About Character Names

Depending on the current version of the script and what Kindroid returns, exported messages may or may not include the character's display name.

For a single AI chat, some versions of this script may ask for the character name and your user display name so it can fill in missing `display_name` values locally.

For example, if Kindroid returns this:

```
{
  "sender": "ai",
  "message": "Hi Matthew, thank you for creating me!"
}
```

the script may be able to save it as:

```
{
  "sender": "ai",
  "display_name": "Lisa",
  "message": "Hi Matthew, thank you for creating me!"
}
```

This is safe for one-on-one AI chats because there is only one AI speaker.

For group chats, this should be handled more carefully because multiple AI characters may be speaking. If all the API says is `sender: "ai"`, the script cannot safely know which character said what unless Kindroid provides more speaker information.

Troubleshooting

“python is not recognized”

Windows does not know where Python is installed.

Try:

```
py app.py
```

If that works, use `py` instead of `python`.

If neither works, reinstall Python and make sure to check:

```
Add Python to PATH
```

“No module named requests”

The required package is not installed.

Run:

```
python -m pip install requests
```

or on macOS/Linux:

```
python3 -m pip install requests
```

Then run the script again.

“Unauthorized”

Your API key was rejected.

Check that:

- It starts with `kn_`
- You copied the whole thing
- There are no extra spaces
- The key is still active

“Forbidden”

The API key may be valid, but the request is not allowed.

Possible reasons:

- The AI ID or group ID does not belong to your account
- The group chat requires a subscription level your account does not have
- The ID was copied incorrectly

“Bad request”

The API did not understand the request.

Check that:

- You entered an AI ID for a single AI export

- You entered a group ID for a group export
- You did not accidentally paste the API key where the AI ID should go
- You did not include extra spaces

“Rate limited”

Kindroid is telling the script to slow down.

Usually, you do not need to do anything. The script will wait and retry.

If it happens constantly, let the script run slowly. Do not start multiple copies of the script.

The export seems frozen

If the script says it is pausing because of rate limits, it is probably not frozen.

Give it time.

If you need to stop it, press:

```
Ctrl + C
```

Then run the script again later and resume from the checkpoint.

I cannot find my exported file

Look in the same folder as `app.py`.

Search your computer for:

```
kindroid_export
```

or search for:

```
.json
```

Keeping Your Export Private

Your exported chat file may contain personal conversations, private roleplay, names, links, images, or other sensitive information.

Be careful with it.

Recommended safety tips:

- Do not upload your exported chats publicly
- Do not commit exports to GitHub
- Keep exports in a private folder
- Back them up only somewhere you trust
- Delete old exports you no longer need
- Never share your API key

If you are using GitHub, add this to your `.gitignore` file:

```
*.json  
kindroid_export_checkpoint.json
```

That helps prevent accidentally uploading your exports or checkpoint file.

Plain-English Summary

To use the script:

1. Install Python
2. Put `app.py` in its own folder
3. Open a terminal in that folder
4. Run `pip install requests`
5. Run `python app.py`
6. Paste your Kindroid API key
7. Choose single AI or group chat
8. Paste the AI ID or group ID
9. Press Enter to accept the suggested output file name
10. Let it run until it says the export is complete

The result is a `.json` file containing your exported chat messages.
